Homework # 6, due on Friday, February 20

[1] (a) Show in discrete variables that

$$\mathcal{F}\left(f(x,y)e^{2\pi i(u_0\frac{x}{M}+v_0\frac{y}{N})}\right) = F(u-u_0,v-v_0),$$

where $F = \mathcal{F}(f)$.

- (b) Using (a), deduce the formula used in shifting the center of the transform by multiplication with $(-1)^{x+y}$, when $u_0 = M/2$ and $v_0 = N/2$, with M and N even positive integers.
- [2] Show the translation property

$$\mathcal{F}(f(x - x_0, y - y_0)) = F(u, v)e^{-2\pi i(x_0u/M + y_0v/N)},$$

where $F(u, v) = \mathcal{F}(f(x, y))$.

- [3] Consider the linear difference operator g(x,y) = f(x+1,y) f(x,y). Obtain the filter transfer function, H(u,v), for performing the equivalent process in the frequency domain.
- [4] Prove the validity of the discrete convolution theorem in one variable (you may need to use the translation properties).
- [5] Assume that f(x) is given by the discrete IFT formula in one dimension. Show the periodicity property f(x) = f(x + kM), where k is an integer.
- [6] (a) Implement the Gaussian lowpass filter in Eq. (4.3-8), using a radius $D_0 = 25$, and apply the algorithm to Fig4.11(a).
- (b) Highpass the input image used in (a), using a highpass Gaussian filter of radius $D_0 = 25$ (see eq. (4.4-4)).
