## Computer Project 2

Due on Friday, June 9, 2006

Use  $P_1$  elements to approximate the solution of

$$-\Delta u + u = \sin(2\pi(x + y)), \quad (x, y) \in \Omega = \text{unit square}$$

with the following boundary conditions:

Case (a)  $u = 0$  for  $(x, y) \in \partial\Omega$

Case (b)  $u = 0$  for  $(x, y) \in \partial\Omega, x = 0, 1$   
 $u_y = 0$ , for  $(x, y) \in \partial\Omega, y = 0, 1$ .

Base the triangulation on a 10x10 grid.

- What you should turn in: the weak formulations, the linear systems, details about the discretizations, plots of the results, your computer program, etc.
- Section 12.2 of the textbook discusses numerical integration (quadrature) formulas, helpful to discretize the load vector, if needed.
