Problem 1 5 pts

Problem 2  7 pts
In a small European country, each city is connected to other cities of the country by five roads. There are 25 inter-city roads in the country. How many cities are there?

Problem 3  7 pts
Is it possible to draw an octahedron without lifting the pencil off the paper? If you think it is possible, please draw the solid this way, indicating the order in which the edges are drawn by numbers. If you think it is not possible, please explain why.
Problem 4  
What is the minimal number of times you need to lift the pencil off the paper to draw a cube without repeating any edge? Give a reason for choosing the number.

Problem 5  
There are three ponds in a botanical garden, connected by ten non-intersecting brooks so that the ducks can swim from any pond to any other. How many islands are there in the garden?
Problem 6

Draw a spherical projection of a spherical cube such that the North pole of the sphere is an interior point of one of the edges of the original graph.

Problem 7

Let a simple connected planar graph have $V$ vertices, $E$ edges, and $F$ faces. Prove that

$$\sum \text{deg}(F_i) = 2E.$$
Problem 8  
Let a finite connected simple planar graph have $E > 1$ edges and $F$ faces. Prove that then $2E \geq 3F$.

Problem 9  
Prove that for a finite connected simple planar graph, $E \leq 3V - 6$.

Problem 10  
Prove that a connected simple planar graph contains at least one vertex of degree 5 or less.
Recall that a *Platonic solid* is a 3D regular convex polyhedron. This means that all of its faces are congruent regular convex polygons, all the vertices have the same degree, $D_v$, and all of its faces have the same degree, $D_f$.

**Problem 11**

14 pts

*Prove that* $3 \leq D_v \leq 5$ *and* $3 \leq D_f \leq 5$. 
Problem 12

Classify Platonic solids.
