Lesson 6: Games and Geometry

Konstantin Miagkov

February 22, 2018

Problem 1.
Two players are playing a game. Initially, the number 1 is written on the board. A move consist of adding any number from 1 to 5 to the current number. The person who makes the number on the board equal to 30 wins. Who has a winning strategy – the first player, or his opponent?

Problem 2.
Two players are playing on a $9 \times 9$ board by placing stones in the squares. It is not allowed to place a stone on a square if it already has one, or if it is adjacent to a square with a stone. Who has a winning strategy?

Problem 3.
Two players place rooks on the $8 \times 8$ chess board. The person after whose turn all squares of the board are attacked by rooks wins. Who has a winning strategy?
