## **HOMEWORK 2**

**Exercise 1.** Let  $\{A_i\}_{i \in I}$  be an infinite family of closed sets with the finite intersection property. Assuming that one member of this family is compact, show that  $\bigcap_{i \in I} A_i \neq \emptyset$ .

**Exercise 2.** Let (X, d) be a metric space and let  $A \subseteq X$  be a compact subset. Show that

(a) For any  $y \in X$  there exists  $x \in A$  so that d(y, A) = d(y, x). (b) If  $B \subseteq X$  and d(A, B) = 0 then  $A \cap \overline{B} \neq \emptyset$ .

**Exercise 3.** Let  $(X, d_X)$  be a compact metric space. (a) Verify that

$$d_Y(f,g) = \sum_{n \in \mathbb{Z}} 2^{-|n|} d_X(f(n),g(n))$$

defines a metric on  $Y = \{f : \mathbb{Z} \to X\}$ . (b) Show that Y is compact.

**Exercise 4.** (a) Show that the closed unit ball in  $\ell^2$ , namely,

$$A = \left\{ x \in \ell^2 : \sum_{n=1}^{\infty} |x_n|^2 \le 1 \right\}$$

is not compact in  $\ell^2$ .

(b) Define  $B \subseteq \ell^2$  by

$$B = \left\{ x \in \ell^2 : \sum_{n=1}^{\infty} n |x_n|^2 \le 1 \right\}.$$

Show that B is compact.

**Exercise 5.** Let A be a subset of a complete metric space. Assume that for all  $\varepsilon > 0$ , there exists a compact set  $A_{\varepsilon}$  so that

$$\forall x \in A, \quad d(x, A_{\varepsilon}) < \varepsilon.$$

Show that  $\overline{A}$  is compact.

**Exercise 6.** Let  $(X, d_1)$  and  $(Y, d_2)$  be two compact metric spaces. Show that the space  $X \times Y$  endowed with the 'Euclidean' distance

$$d((x_1, y_1), (x_2, y_2)) = \sqrt{d_1^2(x_1, x_2) + d_2^2(y_1, y_2)}$$

is a compact metric space.

**Remark 1.** The result in Exercise 6 continues to hold if the 'Euclidean' metric is replaced by either of the equivalent metrics

$$d((x_1, y_1), (x_2, y_2)) = d_1(x_1, x_2) + d_2(y_1, y_2)$$

or

$$d((x_1, y_1), (x_2, y_2)) = \max_{1} \{ d_1(x_1, x_2), d_2(y_1, y_2) \}.$$

**Exercise 7.** Consider the Cantor set

$$K = \{ x \in [0,1] : x = \sum_{n=1}^{\infty} a_n 3^{-n} \text{ with all } a_n \in \{0,2\} \}.$$

For example,  $1 \in K$  because it is represented by setting all  $a_n = 2$ .

- (a) Show that K is compact.
- (b) Show that K is uncountable.
- (c) Show that no connected subset of K contains more than one point.
